Lab: Basic Syntax, Conditional Statements and Loops

Problems for exercises and homework for the "Programming Fundamentals" course @ SoftUni.

You can check your solutions in Judge.

1. Student Information

You will be given 3 lines of input - student name, age, and average grade. Your task is to print all the info about the student in the following format: "Name: {student name}, Age: {student age}, Grade: {student grade}".

Examples

Input	Output
John 15 5.40	Name: John, Age: 15, Grade: 5.40
Steve 16 2.50	Name: Steve, Age: 16, Grade: 2.50
Marry 12 6.00	Name: Marry, Age: 12, Grade: 6.00

Solution

First, we need a scanner, which we can use to read data from the console.

```
Scanner sc = new Scanner(System.in);
```

Read all the information – student name, age, and grade

```
String name = sc.nextLine();
int age = Integer.parseInt(sc.nextLine());
double grade = Double.parseDouble(sc.nextLine());
```

Finally, we need to print the information in the specified format

```
System.out.printf("Name: %s, Age: %d, Grade: %.2f",
        name, age, grade);
```

2. Passed

Write a program that takes as an input a grade and prints "Passed!" if the grade is equal or more than 3.00.

Input

The **input** comes as a single floating-point number.

Output

The output is either "Passed!" if the grade is equal or more than 3.00, otherwise, you should print nothing.

Examples

Input	Output	Input	Output
5.32	Passed!	2.34	(no output)

3. Passed or Failed

Modify the above program, so it will print "Failed!" if the grade is lower than 3.00.

Input

The input comes as a single double number.

Output

The **output** is either "**Passed!**" if the grade is **more than 2.99**, otherwise, you should print "**Failed!**".

Examples

Input	Output
5.32	Passed!

Input	Output
2.36	Failed!

Hint

We need to take a **floating-point** number from the console. After that, print in the **else** statement the appropriate message.

```
double grade = Double.parseDouble(sc.nextLine());
if (grade >= 3.00) {
    //TODO
} else {
    //TODO
```

4. Back in 30 Minutes

Every time John tries to pay his bills, he sees on the cash desk the sign: "I will be back in 30 minutes". One day John was sick of waiting and decided he needed a program that prints the time after 30 minutes. That way he won't have to wait at the desk and come at the appropriate time. He gave the assignment to you, so you have to do it.

Input

The input will be on two lines. On the first line, you will receive the hours, and on the second, you will receive the minutes.

Output

Print on the console the time after 30 minutes. The result should be in the format "hh:mm". The hours have one or two numbers, and the minutes always have two numbers (with leading zero).

Constraints

The hours will be between 0 and 23.

The minutes will be between 0 and 59.

Examples

Input	Output
1	2:16
46	

Input	Output
0	0:31
01	

Input	Output
23	0:29
59	

Input	Output
11	11:38
08	

Input	Output
11	12:02
32	

Hints

Add 30 minutes to the initial minutes that you receive from the console. If the minutes are more than 59 – increase the hours by 1 and decrease the minutes by 60. In the same way, check if the hours are more than 23. When you print, check for leading zero.

5. Month Printer

Write a program that takes an integer from the console and prints the corresponding month. If the number is more than 12 or less than 1 print "Error!".

Input

You will receive a single integer on a single line.

Output

If the number is within the boundaries, print the corresponding month, otherwise, print "Error!".

Examples

Input	Output
2	February

Input	Output
13	Error!

Hints

```
int month = Integer.parseInt(sc.nextLine());
switch (month) {
    case 1:
        System.out.println("January");
        break;
    case 2:
        System.out.println("February");
    //TODO: Add the of the cases
        System.out.println("December");
        break;
    default:
        System.out.println("Error");
        break;
```

6. Foreign Languages

Write a program that prints the language that a given country speaks. You can receive only the following combinations: English is spoken in England and USA; Spanish is spoken in Spain, Argentina, and Mexico; for the others, we should print "unknown".

Input

You will receive a single country name on a single line.

Output

Print the language, which the country speaks, or if it is unknown for your program, print "unknown".

Examples

Input	Output
USA	English

Input	Output
Germany	unknown

Hint

Think about how you can merge multiple cases to avoid writing more code than you need to.

7. Theatre Promotions

A theatre is having a ticket sale, but they need a program to calculate the price of a single ticket. If the given age does not fit one of the categories, you should print "Error!". You can see the prices in the table below:

Day / Age	0 <= age <= 18	18 < age <= 64	64 < age <= 122	
Weekday	12\$	18\$	12\$	
Weekend 15\$		20\$	15\$	
Holiday	5\$	12\$	10\$	

Input

The input comes in two lines. On the first line, you will receive the type of day. On the second – is the age of the person.

Output

Print the ticket price according to the table, or "Error!" if the age is not in the table.

Constraints

- The age will be in the interval [-1000...1000].
- The type of day will always be valid.

Examples

Input	Output
Weekday 42	18\$

Input	Output			
Holiday -12	Error!			

Input	Output		
Holiday 15	5\$		

Input	Output
Weekend 122	15\$

Hints

We need to read two lines. The first one will be the type of day. We will convert it to lower case letters with the method "toLowerCase()". After that, we will read the person's age and declare a variable - price, which we will use to set the ticket price.

```
String day = sc.nextLine().toLowerCase();
int age = Integer.parseInt(sc.nextLine());
double price = 0.0;
```

For every type of day, we will need to add different cases to check the person's age and set the price. Some age groups have equal prices for the same type of day. This means we can use logical operators to merge some of the conditions.

```
if (day.equals("weekday")) {
    if ((age >= 0 && age <= 18) || (age > 64 && age <= 122))
        price = 12;
    } else if (age > 18 && age <= 64) {</pre>
        price = 18;
 TODO: Add the other cases
```

Think where and how you can use logical operators for the other cases.

We can check if the **price** has a value is different from the initial one. If it does, that means we got a valid combination of day and age, and the ticket price is saved in the price variable. If the price has a value of 0, then none of the cases got hit, therefore, we have to print the error message.

```
if (price != 0) {
    //TODO
} else {
    //TODO
```

8. Divisible by 3

Write a program that prints all the numbers from 1 to 100, which are divisible by 3. You have to use a single for loop. The program should not receive input.

Solution

```
for (int i = 3; i \le 100; i += 3)
    System.out.println(i);
```

9. Sum of Odd Numbers

Write a program that prints the next **n odd numbers** (starting from 1) and on the **last row** prints the **sum of them**.

Input

On the first line, you will receive a number – n. This number shows how many odd numbers you should print.

Output

Print the next **n** odd numbers, starting from **1**, separated by **new lines**. On the last line, print the **sum** of these numbers.

Constraints

n will be in the interval [1...100]

Examples

Input	Output
5	1
	3 5
	5
	7
	9
	Sum: 25

Input	Output
w	1 3 5 Sum: 9

Hints

```
int n = Integer.parseInt(sc.nextLine());
int sum = 0;
for (int i = 0; i < n; i ++) {
    //TODO
System.out.printf("Sum: %d", sum);
```

Multiplication Table 10.

You will receive an integer as input from the console. Print the 10 times table for this integer. See the examples below for more information.

Output

Print every row of the table in the following format:

```
{theInteger} X {times} = {product}
```

Constraints

• The integer will be in the interval [1...100]

Examples

Input	Output					
5	5	Χ	1	=	5	
	5	Χ	2	=	10	
	5	Χ	3	=	15	
	5	Χ	4	=	20	

Input	Output					
2	2 X 1 = 2					
	2 X 2 = 4					
	2 X 3 = 6					
	2 X 4 = 8					

5	Χ	5	=	25 30 35 40 45 50
5	Χ	6	=	30
5	Χ	7	=	35
5	Χ	8	=	40
5	Χ	9	=	45
5	Χ	16) =	= 50

2	Χ	5	=	10 12 14 16 18 = 20
2	Χ	6	=	12
2	Χ	7	=	14
2	Χ	8	=	16
2	Χ	9	=	18
2	Χ	16) =	= 20

Multiplication Table 2.0 11.

Rewrite your program so it can receive the multiplier from the console. Print the table from the given multiplier to 10. If the given multiplier is more than 10 - print only one row with the integer, the given multiplier, and the **product**. See the examples below for more information.

Output

Print every row of the table in the following format:

{theInteger} X {times} = {product}

Constraints

The integer will be in the interval [1...100]

Examples

Input	Output
5	5 X 1 = 5
1	5 X 2 = 10
	5 X 3 = 15
	5 X 4 = 20
	5 X 5 = 25
	5 X 6 = 30
	5 X 7 = 35
	5 X 8 = 40
	5 X 9 = 45
	5 X 10 = 50

Input	Output
2	2 X 5 = 10
5	2 X 6 = 12
	2 X 7 = 14
	2 X 8 = 16
	2 X 9 = 18
	2 X 10 = 20

Input	Output
2 14	2 X 14 = 28

12. **Even Number**

Take as an input an even number and **print its absolute value** with a message: "The number is: {absoluteValue}". If the number is odd, print "Please write an even number." and continue reading numbers.

Examples

Input	Output	
1	Please write an even number.	
3	Please write an even number.	
6	The number is: 6	

Input	Output	
-6	The number is: 6	

Refactor Sum of Odd Numbers 13.

You are assigned to find and fix the bugs in an existing piece of code, using the debugger. You should trace the program execution to find the lines of code that produce incorrect or unexpected results.

You are given a program (existing source code) that prints the next n odd numbers (starting from 1) and on the last row, prints the sum of them.

Examples

Input	Output
5	1
	3 5
	5
	7
	9
	Sum: 25

Input	Output
3	1 3 5 Sum: 9

```
SumOddNumbers.java
Scanner sc = new Scanner(System.in);
int n = Integer.parseInt(sc.nextLine());
int sum = 1;
for (int i = 0; i <= n; i++) {</pre>
    System.out.print(2 * i + 1);
    sum += 2 * i;
System.out.printf("Sum: %d%n", sum);
```
